# Asphalt Seal & Repair's Diamond Blend Polymer Modified Pavement Coating

*Diamond Blend* is a premium quality emulsion pavement sealer fortified with rubber polymers and special surfactants. *Diamond Blend* is mixed on site with specifically selected aggregate and applied at a rate of 60-65% solids.

**Composition:** *Diamond Blend* is a polymer-modified, clay stabilized emulsion pavement sealer fortified with special surfactants to promote superior adhesion and durability. *Diamond Blend* is mixed with select aggregate. It provides a safe, skid-resistant surface for both pedestrian and vehicle traffic. *Diamond Blend* dries faster than conventional pavement sealers that are diluted with water prior to application. *Diamond Blend* protects pavement from oxidation, moisture intrusion, fuel and oil. It's deep, rich black color gives old, oxidized pavement a "like new" surface that melts snow and ice faster and reduces cleaning and maintenance costs.

**Basic Uses:** *Diamond Blend* is designed to beautify and protect asphalt pavement surfaces including parking lots, airports, driveways and roadways.

**Application:** For optimum performance and durability, apply two coats of *Diamond Blend* with sand. A third coat of *Diamond Blend* with sand may be applied to high traffic areas such as entrances, exits and drive lanes. The authorized professional applicator warrants application of the *Diamond Blend System* for two years under normal weather and traffic stress.
